AB The invention relates to novel anticholinergic agents I·X- [X - = neg. charged anion; A, B = O, S, NH, CH2, CH:CH, N-(C1-4-alkyl); R = H, OH, C1-4-alkyl, C1-4-alkoxy, (C1-4-alkylene)-halogen, O-(C1-4-alkyl)-halogen, (C1-4-alkylene)-OH, CF3, CHF2, (C1-4-alkylene)-(C1-4-alkoxy), OC(:O)-(C1-4-alkyl), OC(:O)-(C1-4-alkylene)-halogen, (C1-4-alkylene)-(C3-6-cycloalkyl), OC(:O)CF3, halogen; R1, R2 = C1-5-alkyl (optionally substitute with C3-6-cycloalkyl, OH, halogen); R1R2 = C3-5-alkylene; R3, R3', R4, R4' = H, C1-4-alkyl, OH, CF3, CHF2, CN, NO2, halogen; Rx, Rx' = H, C1-4-alkyl, OH, CF3, CHF2, CN, NO2, halogen; RxRx' = single or double bond, O, S, NH, CH2, CH2CH2, N(C1-4-alkyl), CH(C1-4-alkyl), C(C1-4-alkyl)2], their optical isomers, mixts., enantiomers and racemates, to a method for producing said agents from II and to the use thereof as medicaments. Thus, I·Br- [A = B = CH:CH, R = OH, R1 = R2 = Me, R3 = R4 = R3' = R4' = Rx = Rx' = H] was prepared from PH2C(OH)CO2H via esterification with MeI and DBU in MeCN, transesterification with II (α-OH, R1 = Me) and sodium metal in a melt and N-methylation with MeBr in MeCN. The muscarinic acetylcholine receptor binding ability of I·X- was determined (no data). Pharmaceutical formulations containing I·X- are described.

AB The stereochem. of the heterocyclic alcs. (1-4 = I-IV) containing piperidine unit was studied on the basis of the results of mol. mechanics and quantum chemical calcns. The results showed that there existed non-classical orbital super-conjugated interactions between the nitrogen atom and oxygen atom which caused the conformations to be more stable when the hydroxylic group lay at axial than at equatorial with respect to the piperidine ring in compound 1 and compound 3. If the axial hydrogen atoms at C2 and C6 positions in the piperidine ring were substituted, or the mol. existed in the polar solns., this non-classical orbital super-conjugated interactions would be much weaker. In this case, the conformations were more stable when the hydroxylic group was equatorial.

AB 3-Tropyl benzilate, 1-methyl-4-piperidyl benzilate, and 3-quinuclidinylcyclopentyl phenylglycolate, at 10 μg/kg, s.c., caused behavioral changes, especially in locomotion, similar to those induced by atropine and scopolamine in dogs. All compds. exhibited anticholinergic activity, the most effective one being 3-quinuclidinyl-2-thienyl phenylglycolate, which also had the most potent behavioral effect.

AB A series of aminoester hydrochlorides (RCO2CH2CH2NEt2.HCl), which are antagonists of acetylcholine and histamine at postganglionic receptors, were synthesized by conventional methods. Their activity was successfully correlated by Hansch linear free energy relations involving polar, steric, and partition substituent consts. The results are related to receptor-drug interactions.

CODEN: ZORKAE; ISSN: 0514-7492
DOCUMENT TYPE: Journal
LANGUAGE: Russian
GI For diagram(s), see printed CA Issue.
AB A series of tropine (I), MeCH(OH)CH2NEt2 (II), and CH2(OH)CH2NEt2 (III) esters with Ph2C(OH)CO2H (IV), Ph(p-MeOC6H4)C(OH)CO2H (V), (p-MeOC6H4)2C(OH)CO2H (VI), PhCClCO2H (VII), 2,2'-biphenyleneglycolic acid (VIII), 2,2'-biphenyleneacetic acid (IX), Ph(p-MeOC6H4)-CHCO2H (X), and (p-MeOC6H4)2CHCO2H (XI) was prepared The compds. were of potential interest as anticonvulsants, in treatment of parkinsonism, and as central cholinolytic agents. The esters were prepared by transesterification of (for example) IV Et ester with I.HCl salt; IV Et ester was prepared from its Ag salt and EtI. Thus, 0.1 mole IV solution in 150 ml. absolute alc. was combined with 0.1 mole KOH and the mixture evaporated to dryness. The residue was dissolved in water, charcoaled, and boiled with 0.1 mole AgNO3. IV Ag salt precipitated in 85-97% yield. To a mixture of 0.05 mole IV Ag salt a solution of 0.05 mole EtI in 72 ml. anhydrous benzene was added. The mixture was heated .apprx.30 min., filtered, and distilled to give 72.2% yield of IV Et ester, b3-5 150-75°. Similarly other Et esters were prepared (acid, ester % yield, b.p./mm. or m.p. given): V, 77.4, 197-202°/5; VI, 81.5, 215-20°/3-5 (m. 92-8°); VIII, 69.0, m. 87-90°. A mixture of 0.04 g. I, 0.08 g. Na, and 0.02 mole VI Et ester was kept at 130-40° 4-5 hrs. in vacuo increasing from 30-40 mm. to 8-12 mm. The melt was stirred with 120-150 ml. HCl solution The organic layer was separated [1.8 g. of an insol. precipitate was filtered to give (p-MeOC6H4)2CO m. 143-4° (alc.)]. The aqueous layer was boiled with charcoal, filtered, and neutralized with 2N NH4OH solution in the cold. The precipitate was filtered

off, redissolved in absolute alc., and acidified with alc. HCl solution to give 49.4% ester [m. 200-2° (absolute alc.)] of VI and tropinium chloride. Similarly, other esters of tropinium salt were prepared (acid and % yield and m.p. of ester given): IV, 28.0, 238° (absolute alc.); V, 48.2, 194-5° (Et2O-alc.); VIII (VIIIa), 48.9, 240-1° (Et2O-alc.). The ester [m. 207-10° (Me2CO)], of IX and tropinium chloride, was prepared by a direct reaction between I and tech. IX chloride, m. 65-73°, in 74.4% yield. A mixture of 9 g. ester of IV and tropinium-chloride and 16.5 ml. SOCl2 was boiled 4 hrs. Removal of excess SOCl2, extraction with acetone, and crystallization of the residue gave 62% ester [m. 126-8° (benzene-ligroine)] of VII and tropinium chloride. A mixture of 0.04 mole V, 30 g. SnCl2, 80 ml. AcOH, and 60 ml. HCl was stirred 2 hrs. at 30-5° to give 68.5% X. Similarly, XI was prepared in 61% yield. The acids were converted to the chlorides with SOCl2 in 84% (X chloride) and 80% (XI chloride) yields. Esterification of 0.05 mole II with equivalent of X by heating 2 hrs. 115-25° in 15 ml. PhMe gave 53.6% ester of X and II m. 133-5° (Et2O-alc.). In the same way the ester of XI and II, m. 112-14° (Et2O-alc.), and ester of IX and II, m. 165-6° (acetone) were prepared in 30.8 and 77.1% yields, resp. Condensation of Cl(CH2)2NEt2 with IX, X, or XI by boiling in PhMe gave the corresponding ester of IX and III m. 143-4° (PhMe) (65.5%); ester of X and III m. 128-30° (benzene-ligroine) (57.4%), and ester of XI and III m. 155-6° (benzene-ligroine) (60.5%).

AB Expts. were carried out on cats narcotized with hexenal. The bronchomotor tone was measured by Turpaev's method (Fiziol. Zhur. SSSR 39(6), 732-4(1953)). Ten esters of tropine, tested in small doses, weakened the contraction of the bronchus caused by proserine. Methiodide of tropine ester of diphenylmethylacetic acid (0.05-0.2 mg./kg.) weakened the bronchial spasm provoked by proserine; 0.2 mg./kg. prevented spasm development after subsequent administration of proserine. In a dose 0.1 mg./kg. the same compd, inhibited the bronchial spasm observed during irritation of the vagus nerve.

AB cf. CA 55, 9446e. The following esters of tropine with phenylcyclopentanecarboxylic acid (I), diphenylmethyl- (II), diphenylpropyl- (III), phenylpropy]- (IV), and phenylmethylacetic (V) acids, 4-methoxy, 3-methoxy-, 3,4- dimethoxy-, and 3,4,5-trimethoxybenzoic acids, fluorene-9-carboxylic acid (VI) and their hydrochlorides, methiodides, and ethiodides were synthesized to study their pharmacol. effects. The esters of I, II, III, IV, V, and VI show atropine-like properties, they depress acetylcholine contraction of the isolated intestine of cats, and they prevent the hypotensive action of acetylcholine in narcotized cats. Because of their M-cholinolytic effect, the methiodides are more active than the corresponding hydrochlorides and ethiodides. The methiodides of I and II esters decrease the acetytcholine contraction of cat intestine. The M-cholinolytic effect of the esters of benzoic acid derivs. is slight. Methiodides of I and II esters show a papaverine-like effect.
